Introduction to programming with dependent types in Scala

Dmytro Mitin

https://stepik.org/2294

April 2017

Values and types

```
Types
```

Values

```
10 : Int true : Boolean "abc" : String
```

```
Int, Boolean, String, ...
```

```
10, true, "abc", ...
```

Value functions, type families and dependent types

- Value-level function (value depending on another value)
 (x: Int) => x * x, (x: String) => x + "ab", ...
- Type family (type depending on another type)
 Seq[Int], Seq[Boolean], Seq[String], ...
 List[Int], List[Boolean], List[String], ...
- Dependent type (type depending on value of another type)
 Sized[Seq[String], _0], Sized[Seq[String], _1], Sized[Seq[String], _2], ...

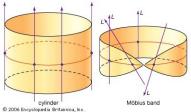

```
val x: Seq[String] = Seq("a", "b", "c")
val x1: Seq[String] = Seq("a", "b", "c", "d")
import shapeless.Sized // Vector type
val x2: Sized[Seq[String], _3] = Sized("a", "b", "c")
val x3: Sized[Seq[String], _3] = Sized("a", "b", "c", "d")
Error(IZ2, 42) type mismatch;
```

found: shapeless.Sized[scala.collection.immutable.indexedSeq[String].shapeless.nat._4]
(which expands to) shapeless.Sized[scala.collection.immutable.indexedSeq[String].shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ[shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]shapeless.Succ[shapeless.Succ]sha

Homotopy type theory (HoTT)

https://homotopytypetheory.org/book/

Fiber bundle

Dependent pair type
 mkPair(n, vn) !: Sgma(n !: Nat, Vec(n))
 (_3, Sized("a", "b", "c")) : Σ(n : Nat, Sized[Seq[String], n])

Type-level programming

- Types
 True, False, _0, _1, _2, ..., Int, Boolean, String, ...
- Values
 True, False, _0, _1, _2, ...
- Type-level calculations (compile time)
 implicitly[(True# && [False])# || [True] =:= True]
 implicitly[(_1# + [_2])# * [_3] =:= _9]
- Value-level calculations (run time)
 (true && false) || true == true
 (True.&&(False)).||(True) == True
 (1 + 2) * 3 == 9
 (_1.+(_2)).*(_3) == _9

Theorem proving

```
import provingground._
import HoTT._
import TLImplicits._
import shapeless._
val indN_{-}assoc = NatInd.induc(n :-> (m \sim>: (k \sim>: (
  add(add(n)(m))(k) = := add(n)(add(m)(k)))))
val hyp = "(n+m)+k=n+(m+k)" :: m \sim : k \sim : (
  add(add(n)(m))(k) = := add(n)(add(m)(k))
val assoc = indN_assoc(m : \sim > (k : \sim > add(m)(k).refl))(
  n : \sim > (h \lor p : - > (m : \sim > (k : \sim >
     Identity Typ.extnslty (succ)(add(add(n)(m))(k))
       (add(n)(add(m)(k)))(hyp(m)(k))
  ))))
assoc!: n \sim >: m \sim >: k \sim >: (
  add(add(n)(m))(k) = := add(n)(add(m)(k))
```
